Algorithm :

- **Step 1: Initialize**

1. Create an array dist[] of size n
2. Initialize all values to ∞
3. Set: dist[src] = 0

- **Step 2: Relax Edges (k + 1 times)**

4. Repeat for i = 0 to k:

   a. Create a copy:

   temp = copy of dist[]

   b. Traverse all flights:

   For each flight [u, v, price]:

   - If:

     dist[u] ≠ ∞ AND dist[u] + price < temp[v]

   - Then update:

     temp[v] = dist[u] + price

   c. Update main array:

   dist = temp

- **Step 3: Return Answer**

5. After all iterations:

   - If:

     dist[dst] == ∞

     Return -1

   - Else:

     Return: dist[dst]
